

CLOVERLEAF AI - EVIDENCE APPENDIX

Public evidence reviewed 30 August 2026

Scope. This appendix supports the ten-page Executive Brief. It tests whether Cloverleaf AI’s public competitive story is synchronized across five surfaces: current competitor capability, Cloverleaf’s own proof, competitor-authored framing of Cloverleaf, a scan-derived challenger, and crawl/search-readable proof. Public sources only; no internal roadmap, pipeline, win/loss data, product access, customer interviews, or private procurement evidence were used.

Archetype hypothesis. Category Challenger. Cloverleaf publicly positions itself as full-funnel B2G sales intelligence, directly compares against named competitors, and is expanding product, data and integrations. This is an Evidence Axis classification, not a company self-description.

Evidence labels

Label	Meaning
FACT - primary	Directly stated by company/product/investor/competitor source.
FACT - independent	Reported by non-vendor publication.
OBSERVED	Page-state or crawl/search retrieval recorded on review date.
INFERENCE	Evidence Axis interpretation drawn from cited facts.
GUARDRAIL	Boundary preventing overstatement or false equivalence.
UNKNOWN	Cannot be established from public evidence reviewed.

Working conclusion

FACT: The May comparison layer contains stale competitor-state claims; one live comparison page contains conflicting 200K+ and 70K+ speaker proof; two competitors published August pages that describe Cloverleaf as a narrower meeting-intelligence product; NationGraph is a current, funded challenger actively pushing that frame; and current crawl/search retrieval can expose zero-value placeholders for key proof metrics.

INFERENCE: The public competitive story is not synchronized across product reality, comparison copy, external category framing, and machine-readable proof. The issue is broader than page freshness.

UNKNOWN: Whether these discrepancies affect buyer trust, win/loss outcomes, search conversion, AI-generated answers, or private battlecards; why the 70K+/200K+ speaker counts differ; and the technical cause of zero-value crawl retrieval.

1. Trigger and chronology

The financing headline is context, not the decision trigger. Cloverleaf and S3 state that the \$8M round closed in January 2026. GovTech reported on 28 August that the company delayed announcing the financing until it had other growth news to report.

“The company delayed announcing the most recent funding until it had other news to report about growth.” - GovTech, citing a company spokesperson

Evidence point	Source	Classification / handling
\$8M round closed Jan 2026; Cloverleaf calls it Series A.	S1	FACT - primary
S3 Ventures repeats January close and Series A.	S2	FACT - investor primary
GovTech calls same financing a seed round from early 2026.	S10	FACT - independent; naming contradiction
GovTech says spokesperson confirmed delayed announcement until growth news.	S10	FACT - independent report of spokesperson
Both comparison pages state data reflects May 2026.	S4, S6	FACT - primary / page-state

Funding naming inconsistency

GovTech labels the \$8M financing a seed raise; Cloverleaf and its lead investor label it Series A. The inconsistency is unresolved here and is not material to the competitive findings.

Decision exposure

Relevant sequence: January close -> product/GTM investment -> May comparison snapshot -> August competitor pages using an older Cloverleaf frame -> August product/growth disclosure. The decision question is whether the public competitive proof and category story should still be used as-is.

2. Finding 1 - Starbridge MCP availability

Finding statement. Cloverleaf's live Starbridge comparison says its data reflects May 2026 public information and marks Starbridge MCP Server Access as not available. Starbridge's current public platform and use-case pages now offer MCP access to buyer intelligence through ChatGPT, Claude and other MCP-compatible tools.

Evidence point	Source	Classification
Cloverleaf vs Starbridge states public information as of May 2026.	S4	FACT - primary
Starbridge MCP Server Access is marked "Not available."	S4	OBSERVED / FACT - page-state
Starbridge current platform lists MCP access into ChatGPT, Claude and MCP-compatible tools.	S5	FACT - competitor primary
Current Starbridge surface therefore conflicts with the May availability cell.	S4,S5	INFERENCE from conflicting states

Guardrail

Allowed: one Starbridge availability claim is contradicted by Starbridge's current product surface. Not allowed: Starbridge has parity with Cloverleaf; Starbridge is better; Starbridge had MCP before May; the stale cell caused lost deals.

Decision interpretation

INFERENCE. A buyer who catches Cloverleaf on one easy-to-check, outdated comparison claim may become more skeptical of claims that are harder to verify. Low-regret action: correct the cell and re-audit short-shelf-life competitor claims.

3. Finding 2 - Pursuit product boundary

Finding statement. Cloverleaf’s May comparison cites Pursuit at 110,000+ SLED entities and frames the gap around an earlier SLED/document-centered product. Pursuit’s Summer 2026 release now presents 170,000+ public-sector entities plus agentic workflows, Play Builder, CRM actions, API/MCP connectivity and automated FOIA/incumbent-contract data.

Evidence point	Source	Classification
Cloverleaf page states data reflects May 2026.	S6	FACT - primary
Cloverleaf cites Pursuit at 110,000+ SLED entities.	S6	FACT - primary
Pursuit Summer release says 170,000+ public-sector entities.	S7	FACT - competitor primary
Release introduces agentic workflows + Play Builder.	S7	FACT - competitor primary
Release describes CRM upsert, Instantly, API + MCP.	S7	FACT - competitor primary
Release describes automated FOIA / incumbent-contract depth.	S7	FACT - competitor primary

Coverage-number guardrail

Do not say Pursuit added exactly 60,000 entities. The public figure changed from 110K+ on Cloverleaf’s May comparison to 170K+ on Pursuit’s current release; definitions and counting rules may differ.

Decision interpretation

INFERENCE. Re-test Pursuit as a broader signal-to-action competitor before using the May comparison as a current battlecard. This does not establish parity, equal signal quality, or equivalent coverage depth.

4. Finding 3 - speaker-count inconsistency

Finding statement. The live Cloverleaf-vs-Pursuit page says 200,000+ identified speakers in its current positioning section, then later uses 70,000+ government / verified speakers in the comparison and Vocal Fingerprinting proof. Cloverleaf had already stated more than 200,000 verified speakers in September 2025, eight months before the May 2026 snapshot date cited by the comparison.

Evidence point	Source	Classification
23 Sep 2025 update: over 200,000 verified speakers; FAQ repeats more than 200,000 verified government speakers.	S8	FACT - primary
Live Pursuit comparison, upper section: 200,000+ identified speakers.	S6	OBSERVED / FACT - same URL
Same URL, comparison / Vocal Fingerprinting section: 70,000+ government or verified speakers.	S6	OBSERVED / FACT - same URL
Current Product page: 70,000+ agencies, 200,000+ identified speakers.	S9	FACT - primary
26 Aug release: 200K+ verified public-sector speakers.	S1	FACT - primary
GovTech: more than 200,000 public-sector speakers.	S10	FACT - independent

Unknown / guardrail

UNKNOWN: why the 70K+ and 200K+ counts differ; whether denominators, verification standards or inclusion rules differ. Do not call it a copy-paste error, data-quality failure or intentional misstatement without internal evidence.

Decision interpretation

INFERENCE. Vocal Fingerprinting is positioned as a core differentiator. The proof attached to that differentiator should be reconciled before the count is used as a stable competitive claim.

5. Finding 4 - external category frame

Finding statement. Two competitors published live buyer-facing Cloverleaf pages in August 2026 that reduce Cloverleaf to a narrower meeting-intelligence frame and use older public metrics. An independent Airframe research page reviewed 29 Aug still describes Cloverleaf's differentiation as meeting-first intelligence. The rival pages are not neutral product truth; together, the three surfaces are evidence of the story buyers can currently encounter.

Evidence point	Source	Classification
Civic IQ, updated 12 Aug: calls Cloverleaf "meeting intelligence," uses 45K+ agencies and 70K+ speakers, and says MCP is not described.	S13	FACT - competitor-authored framing
NationGraph, 24 Aug: calls Cloverleaf a meeting-intelligence platform, "deep on one source," and says non-meeting sources are not a focus.	S11	FACT - competitor-authored framing
Airframe, reviewed 29 Aug: describes Cloverleaf differentiation as "meeting-first intelligence" and best fit around meeting-derived pre-solicitation signals.	S16	FACT - independent research framing
Current Cloverleaf Product page: full-funnel B2G; 70K+ agencies; 200K+ speakers; multiple non-meeting data types; MCP; Salesforce plus CRM options.	S9	FACT - primary current product
26 Aug release: dataset grew well past video and contact library crossed 1M+ contacts and speakers.	S1	FACT - primary current product context

Guardrail

The rival pages predate or closely bracket Cloverleaf's 26 Aug public growth disclosure. They may reflect timing rather than negligence. They remain live now. Airframe was reviewed on 29 Aug and was live after the announcement; its publication date was not established, so it supports current persistence of the meeting-first frame, not a claim about when Airframe first adopted it. NationGraph's comparison page also carries noindex directives for GPTBot, ClaudeBot, Google-Extended and other AI crawlers. It is human-readable, but this specific page should not be assumed to influence AI-generated answers.

Decision interpretation

INFERENCE. Cloverleaf's new full-funnel positioning is not yet controlling how at least two active competitors and one independent research surface define it. The strategic question is whether public positioning and search surfaces make the expanded product legible before rival pages freeze the older frame.

6. Finding 5 - NationGraph challenger

Finding statement. NationGraph is not merely a comparison-page author. Axios reported an \$18M Series A led by Menlo Ventures in February 2026. NationGraph’s current product claims speaker-level meeting intelligence plus ten additional source types and explicitly positions the buying decision as depth on one source versus breadth around the signal.

Evidence point	Source	Classification
Axios: NationGraph raised \$18M Series A led by Menlo Ventures.	S12	FACT - independent; funding is context only
NationGraph says it reads meeting video/minutes plus budgets, grants, POs, contracts, procurement rules, RFPs, press, institution records and contacts.	S11	FACT - competitor primary
NationGraph concedes Cloverleaf’s meeting depth and Vocal Fingerprinting strengths.	S11	FACT - competitor-authored framing
NationGraph’s wedge: carry the signal to verified contact + incumbent contract + surrounding record.	S11	FACT - competitor positioning
No Cloverleaf-vs-NationGraph page was found in the site search used for this scan.	O2	OBSERVED - search scan, not proof of absence from all private/public material

Guardrail

Funding does not establish product quality, commercial traction or category leadership. NationGraph’s product claims are vendor primary. The useful fact is that a current, financed challenger is directly constructing a buyer-facing frame around Cloverleaf.

Decision interpretation

INFERENCE. NationGraph deserves explicit monitoring because its positioning attacks the boundary Cloverleaf is currently expanding: from meeting signal to full-funnel intelligence. The decision is what durable proof prevents “deep on one source” from becoming the market shorthand.

7. Finding 6 - crawl/search proof zeros

Finding statement. On 30 Aug 2026, two independent web crawl/search retrieval paths returned zero-value placeholders from live Cloverleaf pages while the same pages also exposed the intended non-zero proof elsewhere. This is recorded as an observed retrieval state, not as a claim about every search engine or AI system.

Evidence point	Source	Classification
Homepage visible/current content exposes \$20M sourced revenue and \$1M pipeline per rep/quarter.	S15	FACT / page content
Independent crawl/search retrieval for the homepage exposed "\$0M Sourced Revenue" and "\$0M Pipeline" in result text.	O1	OBSERVED - external retrieval
Current demo-page crawl text exposes "0 K+" agencies while current Cloverleaf product/home surfaces state 70,000+ agencies.	O1	OBSERVED - external retrieval
Pursuit comparison static text says 90%+ daily email open rate nearby; crawl text exposes "0% email open rate" plus multiple "\$0 M" blocks.	S6,O1	FACT + OBSERVED
Technical cause of the mismatch was not established.	-	UNKNOWN

Reproduction notes

Queries used included exact searches for Cloverleaf AI with "\$0 M sourced revenue" and "0% email open rate." Both current comparison URLs also returned zero placeholders in crawlable text. The report does not infer whether the cause is animation, server rendering, structured data, or another implementation detail.

Decision interpretation

INFERENCE. Search engines, AI assistants and comparison crawlers can consume machine-readable text rather than the final rendered counter. If they ingest the zero placeholders, Cloverleaf's strongest customer proof can be weakened before a buyer reaches the page. This should be technically re-tested after a fix.

8. Competitive story synchronization map

Public claim / surface	Current evidence status	Low-regret action
Starbridge MCP unavailable	Contradicted by current Starbridge public evidence	Correct now
Pursuit 110K+ / older workflow boundary	Current 170K+ + agentic/action layer	Refresh / re-test
Cloverleaf speaker count	200K+ and 70K+ on same live page; 200K+ public since Sep 2025	Reconcile metric / definition
Cloverleaf = meeting-first / narrow	Two Aug competitor pages + Airframe 29 Aug still use this frame	Counter with current proof
NationGraph challenger	Funded and directly attacking scope boundary	Add to monitored set
Rendered proof vs crawlable proof	\$20M/\$1M/70K+/90%+ can surface as \$0M/0K+/0% in retrieval	Technical fix + re-test

What this brief does not establish

- Starbridge or Pursuit has product parity with Cloverleaf.
- NationGraph is a better product or is winning head-to-head.
- The 70K+ figure is a typo or copy-paste error.
- Buyer trust has already been damaged.
- Search/AI systems universally display the zero placeholders.
- Private battlecards or internal competitive material are stale.

Paid decision frontier

Which competitive claims should Cloverleaf defend, retire or rebuild when the public pages are tested against current product strategy, sales objections, lost deals, battlecards and search/AI retrieval? The public brief can identify what is out of sync; internal data is required to decide what should become the durable sales frame.

Observation log

O1 - 30 Aug 2026: two independent crawl/search retrieval paths were queried for Cloverleaf proof metrics. Current results exposed \$0M / 0K+ / 0% placeholders from live Cloverleaf pages while opened/current page content elsewhere exposed the intended non-zero values. O2 - 30 Aug 2026: site search for NationGraph on cloverleaf.ai returned no specific Cloverleaf-vs-NationGraph page in the scan used for this brief. O2 is not evidence that no such material exists privately or outside the indexed surface.

Method and QA notes

- Material factual claims were checked against underlying public pages on 30 Aug 2026.
- Scope decision: four competitors are retained because they serve distinct evidence roles - Starbridge and Pursuit test competitor-state drift; Civic IQ and NationGraph test external framing / challenger pressure. This is a deliberate scope exception, not four full competitor profiles.
- Competitor-authored comparison pages are treated as evidence of competitor framing, not neutral product truth.
- Independent sources are used for financing context and external corroboration where available.
- Contradictions are disclosed. Unknowns remain unknown. No claim of parity, buyer trust damage, search ranking impact, or causal revenue loss is made.
