

EVIDENCE AXIS

Caddi Evidence Appendix

Source register, claim matrix, and FACT / INFERENCE / UNKNOWN discipline for Gift #8.

Prepared from public evidence only. Checked: 29 August 2026.

1. Scope and method

This appendix supports the accompanying Executive Brief. It verifies a narrow public-evidence question: whether selected Caddi comparison pages still draw competitive boundaries that match public product evidence from Gumloop, Zapier and UiPath.

Scope limits

Public sources only. No private roadmap, win/loss, customer calls, product access, analytics, sales data or internal Caddi context was used. Vendor-authored sources are treated as primary evidence for what a vendor publicly claims about its own product, not as neutral evidence of market superiority.

Working conclusion

FACT: Three Caddi comparison pages dated 29 May 2026 contain boundaries that are narrower than evidence found in primary competitor materials. INFERENCE: Caddi may benefit from re-testing which differentiators should remain central after the August launch. UNKNOWN: How Caddi internally positions these pages, how buyers react to them, and whether private product evidence changes the analysis.

Finding map

Finding	Type	Evidence shape	Status
Gumloop	Pre-existing gap	Gummie build/update capability predates Caddi page.	FACT + INFERENCE
Zapier	Post-publication drift	AI by Zapier GA moved agentic execution inside core Zap editor after Caddi page.	FACT + INFERENCE
UiPath	Post-publication drift	Delegate Public Preview adds describe/say/demonstrate task input under UiPath controls after Caddi page.	FACT + INFERENCE

2. Source register

ID	Source class	Source	Date	Use in analysis
C1	Caddi primary	Caddi launch announcement https://www.trycaddi.com/blog/caddi-launches-agent-that-builds-back-office-agents	24 Aug 2026	Launch expands product framing: discovery, Loop Studio training, exception extraction, deterministic execution, audit, law/wealth/insurance.
C2	Caddi primary	Caddi vs Gumloop comparison https://www.trycaddi.com/compare/caddi-vs-gumloop	29 May 2026	Frames Gumloop as DIY canvas; says user builds and maintains; frames Caddi as built and maintained for the customer.
G1	Competitor primary	Gumloop Gummie announcement https://www.gumloop.com/blog/gummie-agent	16 Sep 2025	Gummie lets users describe workflows; Gumloop plans/creates flows and supports updating existing workflows through conversation.
C3	Caddi primary	Caddi vs Zapier comparison https://www.trycaddi.com/compare/caddi-vs-zapier	29 May 2026	Frames Zapier as app-to-app glue / trigger-action Zaps the user builds and owns; contrasts Caddi as agentic document-heavy automation.
Z1	Competitor primary	Zapier migration to AI by Zapier https://help.zapier.com/hc/en-us/articles/47402591569805-Migrating-from-Agents-to-AI-by-Zapier	15 Jul 2026	AI by Zapier brings agent tool-calling, AI reasoning and autonomous execution into Zap editor; supports mixed agentic/AI/deterministic steps, approvals and history.
C4	Caddi primary	Caddi vs UiPath comparison https://www.trycaddi.com/compare/caddi-vs-uipath	29 May 2026	Frames UiPath as developer-built bots replaying screen actions; contrasts Caddi as API-driven deterministic code built from recording.
U1	Competitor primary	UiPath Delegate release notes https://docs.uipath.com/delegate/standalone/latest/release-notes/august-2026	25 Aug 2026	Delegate Public Preview: natural language, voice and screen-recording task input, native computer use, platform permissions/audit controls.
U2	Competitor primary	UiPath Delegate introduction https://docs.uipath.com/delegate/standalone/latest/user-guide/introduction	Current docs	Delegate is Public Preview and a desktop AI agent; behavior may change before GA; it can be taught by watching a user once.
P1	Caddi primary	The Planning Center customer story https://www.trycaddi.com/customers/the-planning-center	Current page	Caddi states MoneyGuidePro has no open API and describes a screen-driven loop as the only automation route for that system.

3. Claim-level matrix

Claim	Class	Source IDs	Client-facing wording discipline
Caddi Gumloop comparison frames Gumloop as DIY build-and-maintain canvas.	FACT	C2	Can state directly. Do not infer intent or buyer reaction.
Gumloop Gummie could build workflows from a natural-language description and update existing workflows before the Caddi page was published.	FACT	G1	Can state directly. Avoid saying Gumloop is done-for-you in the same way Caddi is.
The Gumloop distinction is narrower than “you build it there, Caddi builds it.”	INFERENCE	C2, G1	Use “narrower” or “over-simple,” not “false.”
Caddi Zapier comparison was published before AI by Zapier GA in the Zap editor.	FACT	C3, Z1	Frame as market movement after publication, not as wrong from day one.
AI by Zapier supports agentic, AI and deterministic steps, per-tool approvals and Zap History observability.	FACT	Z1	Do not claim it solves Caddi’s regulated back-office job.
UiPath Delegate entered Public Preview after the Caddi UiPath page and supports plain-language, voice and screen-recorded task input under UiPath controls.	FACT	U1, U2	Always label as Public Preview. Do not imply GA or full equivalence.
Caddi has at least one public customer story where screen-driven execution is used because a system lacks an open API.	FACT	P1	Supporting note only. Do not make this a headline or say Caddi is “just RPA.”
Caddi may benefit from re-testing which differentiators remain durable.	INFERENCE	C1-C4, G1, Z1, U1	Allowed as decision implication. Not a claim that the company has an identity problem.

4. Finding 1 - Gumloop

Finding: Caddi’s Gumloop comparison describes Gumloop as a DIY canvas where the customer builds and maintains workflows. Gumloop’s Gummie capability, published before the Caddi page, reduces both build and update burden through conversation.

Evidence point	Source	Classification
Caddi page is dated 29 May 2026 and frames Gumloop as a canvas where the user builds and maintains workflows.	C2	FACT
Gummie post is dated 16 Sep 2025. It says the user can describe a workflow and Gumloop plans/creates the flow.	G1	FACT
Gummie post also describes updating existing workflows by telling Gummie what to change.	G1	FACT
Therefore, the distinction is narrower than a simple “DIY canvas vs built for you” contrast.	C2, G1	INFERENCE

Guardrail

Allowed: Gumloop had conversational build and update capability before the Caddi page was published. Not allowed: Gumloop is equivalent to Caddi; Gumloop has the same vertical focus, execution model, maintenance model or compliance posture.

5. Finding 2 - Zapier

Finding: The Zapier comparison should be framed as post-publication market drift. The 29 May page contrasts Caddi with simple trigger-action Zaps; on 15 July, AI by Zapier brought agentic execution into the Zap editor.

Evidence point	Source	Classification
Caddi Zapier comparison is dated 29 May 2026 and describes Zapier as app-to-app glue / trigger-action Zaps that the user builds and owns.	C3	FACT
Zapier migration document is dated 15 July 2026 and says AI by Zapier with looping tool calls is generally available.	Z1	FACT
Z1 states agent tool-calling, AI reasoning and autonomous execution now run inside a Zap editor step.	Z1	FACT
Z1 describes mixed agentic / AI / deterministic steps, per-tool approvals and observability in Zap History.	Z1	FACT
Therefore the simple-trigger/action boundary moved after the Caddi page was published.	C3, Z1	INFERENCE

Guardrail

Allowed: Zapier moved after publication. Not allowed: the Caddi page was wrong because Agents existed as a separate product before July; Zapier now solves Caddi’s regulated back-office use case; Zapier and Caddi are equivalent.

6. Finding 3 - UiPath

Finding: UiPath Delegate entered Public Preview after the Caddi UiPath comparison and narrows part of the “teach it without building it” contrast. Runtime and deployment model remain different.

Evidence point	Source	Classification
Caddi UiPath comparison is dated 29 May 2026 and frames UiPath as developer-built bots replaying screen actions.	C4	FACT
UiPath Delegate release notes dated 25 Aug 2026 describe Delegate as Public Preview.	U1	FACT
U1 describes natural language, voice and screen-recording task input, plus identity, permission and audit controls.	U1	FACT
U1/U2 describe Delegate as desktop AI agent / native computer use and state Public Preview behavior may change before GA.	U1, U2	FACT
Therefore Delegate narrows the demonstration / governance contrast but does not establish product equivalence.	C4, U1, U2	INFERENCE

Guardrail

Allowed: Delegate entered Public Preview on 25 Aug 2026 and supports describe/say/demonstrate task input. Not allowed: Delegate is GA; UiPath now matches Caddi; Caddi’s runtime resilience claim is false in all cases.

7. Supporting notes and held-out claims

The following items were reviewed but kept out of the main client-facing findings or held as supporting context only.

Item	Status	Reason
Caddi screen-driven fallback in MoneyGuidePro customer story	SUPPORTING FACT	Useful only to qualify absolute API/screen language. It should not become a headline finding or imply Caddi is RPA.
UiPath Integration Service API connectors	HELD OUT	Real capability, but not new and not needed to support the dated Delegate finding.
Zapier Agents before July 2026	HELD OUT	Agents existed separately. The relevant movement for this Gift is migration into the core Zap editor on 15 July 2026.
Self-serve vs managed-business-model shift	HELD OUT	Interesting, but not sufficiently verified for this Gift. It risks turning a comparison-layer finding into a company-identity claim.
Buyer trust damage	NOT ESTABLISHED	No buyer evidence. Do not assert that buyers have lost trust or that credibility has already been harmed.

Client-facing discipline

Use cautious verbs: appears, narrows, may benefit, post-publication movement. Avoid language that accuses intent, declares loss of differentiation, or turns public-page drift into a company-wide strategic diagnosis.

8. Decision frontier

The Gift answers a scoped public-intelligence question: selected comparison pages should be re-tested because their boundaries no longer cleanly match public evidence. It leaves a legitimate paid decision frontier: which differentiators should survive, be qualified, or be monitored after the August launch.

Differentiator to test	Why it matters	Evidence needed in a paid sprint
Undocumented process discovery	This is stronger than generic workflow building if Caddi can prove it surfaces work customers cannot specify upfront.	Customer use cases, product demo evidence, before/after process maps.
Exception extraction with process owner	Caddi's August launch puts real weight on finding edge cases before production.	Demo flows, edge-case examples, customer proof, vertical-specific failure modes.
Deterministic execution where APIs exist	Useful if framed with precision and not as an absolute screen-vs-API binary.	Runtime evidence, system-by-system execution modes, failure/retry handling.
Vendor-owned maintenance	Strong if matched to the tier / customer segment where Caddi actually owns upkeep.	Packaging, SLAs, support model, maintenance workflow, approval model.
Regulated workflow depth	A durable wedge if proof is tied to law, wealth and insurance workflows rather than generic automation language.	Vertical proof, integrations, compliance requirements, buyer language.

Suggested next paid scope: Competitive Decision Sprint - build the claim map, define the durable competitive spine, rewrite one comparison page as a proof case, and set a short watchlist for competitor boundary movement.

9. Final guardrails

Allowed	Not allowed
Three Caddi comparison pages use boundaries that are narrower than the public evidence supports.	Caddi has no differentiation.
Gumloop build/update capability predates the Gumloop comparison page.	Gumloop and Caddi are equivalent.
Zapier’s relevant move happened after the Caddi page, when AI by Zapier went GA inside the Zap editor.	The Zapier page was wrong because standalone Agents existed earlier.
UiPath Delegate is Public Preview and narrows part of the teach-without-building contrast.	UiPath Delegate is GA or fully matches Caddi.
Caddi’s MoneyGuidePro story is a supporting qualifier for absolute screen/API language.	Caddi is just RPA or screen automation.
Caddi may benefit from re-testing durable differentiators.	Caddi has an identity crisis or buyer trust has already been damaged.

Appendix status: Ready for claim-level QA against the Executive Brief. Any client-facing sentence that exceeds these guardrails should be revised before delivery.
